The 5 Focus Quickstarts

Five things you can try today.

No motivational fluff. Each one explained in under 5 minutes.

Study with real focus, without endless cramming.

Pick one. Start there.

This isn't a list of calendar-quote discipline advice. It's five things that actually work when you can't concentrate — and none of them take weeks of practice to feel a difference.

Each quickstart explains why it works in a couple of sentences, then tells you exactly what to do. Not all five at once — pick one today, try it next time you study, and see what happens. My suggestion: start with number 1, it's the foundation the others build on.

And if you're wondering whether five is enough: they're deliberately just the start. They solve the most common problem — getting into focus in the first place. How you actually retain what you study is the next step. More on that at the end.

1 The 25-Minute Start

You want to start, but the moment feels like hitting a wall. So you do something else first. And something else. Suddenly half the afternoon is gone and the book is still closed.

The trick: make the wall smaller. Don't tell yourself "I'll study this afternoon" — commit to exactly 25 minutes, not a minute more. Anyone can do 25 minutes. Your brain stops resisting once the end is in sight. Then a real 5-minute break, away from the desk. Then the next 25.

Here's the strange part: most of the time you'll want to keep going after the break. The resistance was only ever at the start.

→ SOFORT UMSETZEN

Set a timer for 25 minutes. Pick one goal for the round ("get through chapter 3"), put your phone in another room, go. When the timer rings: break — even mid-flow.

2 Close the Book and Recite

The single most common study mistake: rereading a text a fifth time and assuming that, because it feels familiar, it's stuck. It hasn't. Familiarity isn't the same as knowing — you'll find that out the hard way in the exam.

What actually sticks is recalling from memory. So: read a section, close the book, and recite what it said in your own words — out loud or on paper. Wherever you go blank is exactly what you don't know yet. Check it, then move on.

It feels harder than rereading. That's not a bug — it's exactly why it works.

→ SOFORT UMSETZEN

Take today's material. After each section: close the book, recall it freely. Whatever you can't remember, mark it and look at it again specifically.

3 The 90-Second Reset

At some point your concentration tips over. Your eyes drift across the page while your mind runs through the grocery list. Pushing through doesn't help here — you're just producing the feeling of having studied, without anything landing.

Instead of grinding it out, make a clean break: stand up, 90 seconds. Go to a window, take one deep breath, look into the distance (it relaxes your eyes), loosen your shoulders. No phone — that pulls you out completely. Just the reset.

It sounds almost too simple. But the gap between "I've been staring for 20 minutes" and "I'm back" is often exactly these 90 seconds.

→ SOFORT UMSETZEN

Next time you stall: end the round properly, stand up, 90 seconds by a window, no phone. Then deliberately restart.

4 The One-Page Plan

"I have so much left to study" isn't a plan — it's an anxiety spiral. And anxiety makes you either avoid starting altogether or cram everything in a panic right before the deadline.

Take a single sheet of paper. On the left, write down what needs to be solid by when. Break the material into chunks that fit into one 25-minute round each. Spread the chunks across the days you have left. Done. No app, no perfect system — one sheet you can actually see.

The real win isn't the plan itself. It's that the chaos moves out of your head and onto paper. It can't paralyze you from there.

→ **SOFORT UMSETZEN**

Grab a sheet. Break the material into 25-minute chunks, spread across the remaining days. Pin it up wherever you study.

5

Fixing the Phone Problem, Honestly

Be honest: the biggest focus killer usually sits within arm's reach and lights up now and then. That's not a willpower flaw — that device was built by some of the smartest people alive specifically to grab your attention. Fighting it with willpower alone is a losing battle.

So don't fight it — remove the decision entirely. Turning your phone face-down isn't enough; just knowing it's there already costs attention. It needs to leave the room. Another room, a bag, a drawer. Out of sight, out of reach, for the 25 minutes.

You'll be surprised how much quieter your head gets once the constant background "might be something" disappears.

→ **SOFORT UMSETZEN**

Before your next study round: physically take your phone out of the room. Don't flip it — remove it. Notice afterward how different the round felt.

WHAT'S NEXT

Focus is the start. Retention is the rest.

Once you've run these five for a few days, you'll notice getting into focus stops being the hard part. The bigger question becomes how to study material so it's still there four weeks later — without repeating everything ten times.

That's exactly what the full FOKUS-OS covers next: the methods above, developed further, plus the repetition rhythm that beats forgetting, ready-made templates, and a 30-day plan to carry you through.

Keep your spot on the list.

You'll get a few short emails from me over the next days — concrete study tips, no spam. And you'll be first to know when FOKUS-OS launches at its introductory price.

A quick honest note: these techniques are well-established study methods, not miracle cures. They work if you use them — like a tool that has to be picked up. Good luck putting them into practice.
